

Revising your Organics Waste Strategy to Include Composting

Revising the organics waste strategy for municipalities and cities requires a full assessment of current processes, consistent problems, and future solutions. At Atlas Organics, our experience with municipalities stretches as far back as the company itself. We've partnered with over half a dozen municipalities across the US to create a more innovative, streamlined, and cost-effective organics waste strategy that includes composting. We bring these years of experience to our partnerships and to this guide.

This guide was created for YOU. We've outlined the 5 major things to consider when evaluating a revision to your organics waste strategy. Whether you're just starting your assessment or months into the process, this guide will help to fill in the gaps and provide the right questions to ask moving forward.

Collection Hauling and Management

Does the entity self haul/contract haul?
Is there a transfer station?
Other hauling considerations
Program enforcement

Organics Processing Management

Does entity (city/county) have land (landfill/greenwaste site)?
Is it permitted for processing/composting?
Is there a private option for processing?
What are the logistical considerations for delivering organics to processing site?

User Education

Public/government resources (Health departments, other)
Private or non-profit

Contamination Management

Program enforcement
Program enhancement

Finished Product Management
